

Transcendentalism - Part 2

WHAT IS ASTRAL PROJECTION?

2022

Rather than repeating a bunch of subjective experiences that offer you no real benefit, I will outline a complete and rational model for understanding astral projection. Beyond that, this model will form the basis for understanding the nature of literally every intangible concept and influence we are capable of experiencing.

Immanuel Kant first described the philosophy of Transcendental Idealism in his book *Critique of Pure Reason* in 1781. Kant argues that we are only capable of understanding a thing through our perception of it, which is limited to the faculties of our six senses (I'm including intuition as a sense here). Therefore, we are incapable of knowing anything as it truly is, only as it appears to us. The one notable exception is if the thing is truly as we perceive it to be. But of course, there's no way to determine whether or not this is the case. We can employ devices, such as cameras or other forms of sensors. However, as even the name sensor implies, these devices are made to either mimic the human senses or to transform data into a form suitable for the human senses to perceive, thereby reintroducing the very same error.

Moving on from there, Kant further reasons that time and space are concepts that humans have introduced in order for the Universe to appear in a way that our senses are capable of perceiving. Thus implying that time and space are both illusions and thus may not exist at all. But they exist as real to us because their existence is necessary in order for us to perceive any world at all outside of ourselves.

In other words, we inflict the concepts of time and space onto the Universe in order for its appearance to suit our sensibilities.

If that sounds a bit "out there" to you, I challenge you to disprove it. You cannot. Because in order to disprove that claim, you would have to be capable of perceiving "the thing in itself". That is to say, the true nature of the Universe. The fact that even now scientists are only more bewildered than ever about the true nature of Universe only serves to support rather than detract from the veracity of Kant's claim. And so it is that this concept underlies the very concept of astral projection.

To astral project is to alter the nature of one's perceptions. Despite the word projection implying some kind of travel, there is no movement of any kind necessary. Even through the lens of the mind, one can perceive oneself as being in the exact same space-time coordinates that their physical body so stubbornly occupies. But just because it isn't necessary to travel doesn't mean you can't. But that opens up another conceptual problem... how?

How is it possible for the conscious mind to travel outside the body? To answer that, let's start with a little exercise. Right now, close your eyes and imagine the room you are currently in. While remaining well-grounded within your body and moving your head around, try to see the room around you just as you would with your eyes open. Do this for a minute or so. Now try it again without moving your head. How are you doing that? How can you see what is behind you while looking

forward? This is the basis of how astral projection works.

In that exercise, you were not astral projecting. Your mind was able to construct the scene behind you from your imagination. If, for example, I were hiding somewhere in the room with you and quietly came out of my hiding place and seated myself on the floor behind you, you would not have perceived me. That is because the landscape was constructed by your memory rather than being sensed or perceived through some native faculty.

So all the act of astral projection is doing is engaging our intuition to act as our sole sense for perceiving the world. But what is the intuition? We've all had experiences where we intuitively predicted that something was about to happen and then it did. Or we perhaps had an intuitive understanding of a concept we have no memory of ever being exposed to. But what is that? Where does it come from? The answers to those questions can only be found through the practice of exalting the intuition as the lone active sense by causing the other 5 to remain dormant. That is astral projection.

Applied Example: Evocation and the Binocular Mind

Starting with the understanding that we exist as transcendental beings (i.e. the whole Adam Kadmon thing), then we potentially have the ability to direct our consciousness into any plane of existence (or "World").

In the case of astral projection, we go whole hog and direct nearly all of our consciousness into the relevant plane. But it is not necessary to always go to that extreme. It's also possible to just take a quick peek. This is probably most famously done when people claim to be able to see auras. Of course, a camera doesn't record any auras, but the person is adamant that they can, in fact, be seen.

Of course, auras do not exist within the material plane. They are a feature exclusive to the Astral World. That implies a couple of things:

- It's possible to split out consciousness, meaningfully, between two planes of existence.
- The method for doing so is so simple that people can do it by accident.

In the case of a formal evocation using either smoke or a black mirror, each of those devices, along with chanting, will induce a mental state that is susceptible to input from both the physical and astral worlds simultaneously. As luck would have it, our brains are very good at mixing and merging signals from multiple sources of input (e.g. two eyes, two ears). So, your brain works its magick to be able to perceive a blended image of the astral and physical worlds.
